Programming Code Overview

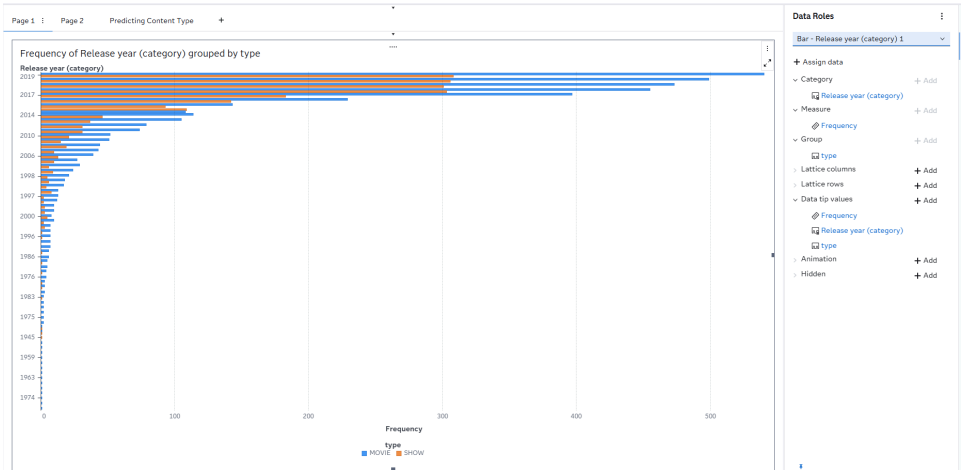
This capstone project was conducted using SAS Visual Analytics and SAS Studio. Rather than manually writing code, the analysis was performed using SAS's graphical modeling interface. This platform allows users to conduct statistical testing, predictive modeling, and visualization through structured workflows.

Analytical procedures performed included:

- Frequency distributions
- Cross-tabulation analysis
- Chi-square hypothesis testing
- Logistic regression modeling
- Decision tree modeling
- Data visualization using bar charts and treemaps

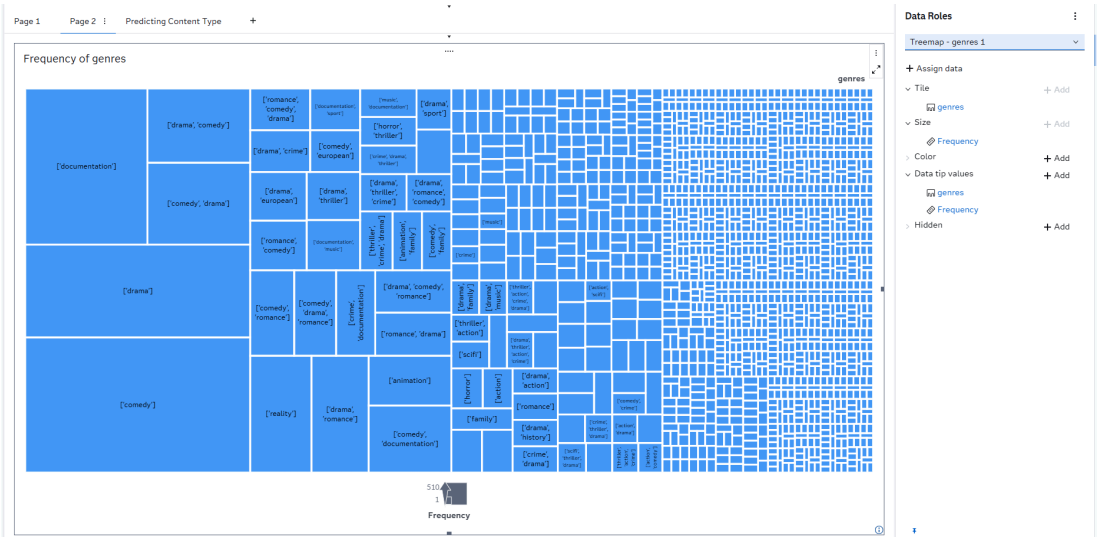
Screenshots of analytical outputs are included below as documentation of the modeling process:

Figure 1. Content Type Distribution by Year



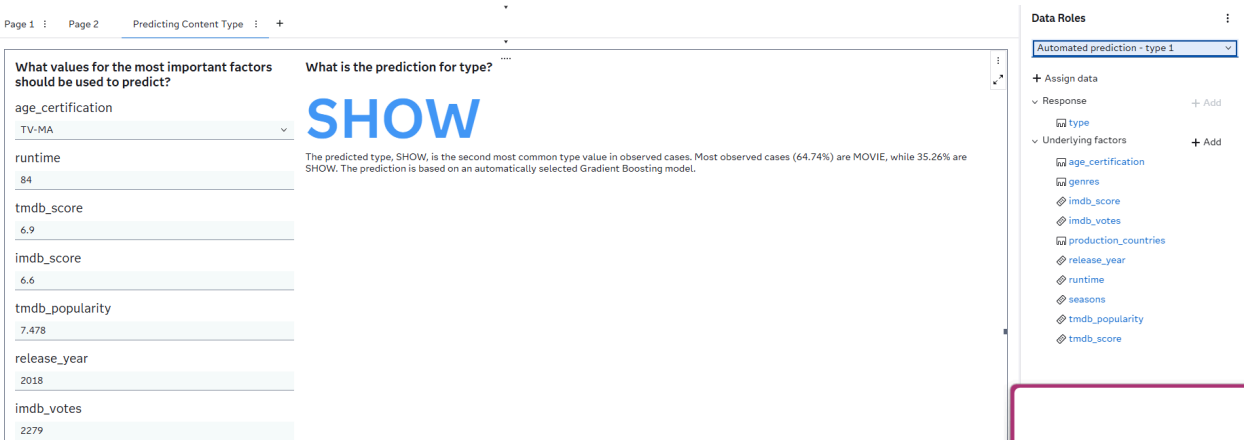
Bar chart generated in SAS Visual Analytics illustrating annual distribution of movies and television shows.

Figure 2. Genre Distribution Treemap



Treemap visualization displaying proportional representation of genre categories within the Netflix catalog.

Figure 3. Predictive Classification Model Output



Screenshot of logistic regression and decision tree modeling results used to classify content type.
